Date	**3 JULY 2026**
Team ID	
Project Name	**Credit Card Approval Prediction**
Maximum Marks	

Project Executable Files

Introduction

This document provides the necessary information to execute the **Credit Card Approval Prediction using Machine Learning** project. The application has been developed using Python, Flask, HTML, CSS, and Machine Learning libraries. By following the instructions provided below, the application can be successfully installed and executed on any system with the required software.

Software Requirements

Software	**Version**
Operating System	Windows 10/11, Linux, macOS
Python	3.10 or above
Visual Studio Code	Latest Version
Google Chrome	Latest Version
Git (Optional)	Latest Version

Python Libraries

The following Python packages are required to run the project:

- Flask
- NumPy
- Pandas
- Scikit-learn
- Joblib

These packages can be installed using:

pip install -r requirements.txt

Project Folder Structure

Credit_Card_Approval_Prediction/

     └── creditcard.csv
```

Steps to Execute the Project

Step 1

Download or clone the project repository.

Step 2

Open the project folder in Visual Studio Code.

Step 3

Open the integrated terminal.

Step 4

Install all required packages.

pip install -r requirements.txt

Step 5

Run the Flask application.

python app.py

Step 6

After successful execution, the terminal displays:

Running on http://127.0.0.1:5000

Step 7

Open the browser and visit

http://127.0.0.1:5000

Step 8

Enter the transaction details (Time, V1–V28, Amount) and click the **Predict** button.

Step 9

The application processes the input using the trained Random Forest model and displays whether the transaction is **Genuine** or **Fraudulent**.

Expected Output

The application successfully predicts the transaction class and displays the result on the output page. The prediction is generated using the trained Random Forest Classifier after applying the required preprocessing steps.

Conclusion

The project can be executed successfully by following the above procedure. The modular architecture, trained machine learning model, and Flask web application ensure smooth execution, reliable prediction, and easy deployment for future enhancements.
